I solve the problem first and choose the technology second. Six products designed, built and released across four different toolchains, because each problem demanded a different one. Technology is an instrument, not an identity.

6	3	4	★ 358	100%
Products shipped & released	Startups built or led	Toolchains: Dart, Rust, Kotlin, TS	GitHub stars, live	Solo: design → build → release

VENTURES & LEADERSHIP

CTO & Head of Product · Senagh · AI assistant for real-estate agents — senagh.ir
Technical and product lead for an AI-agent assistant that works alongside real-estate agents. The system absorbs the repetitive half of the job so the agent spends their hours with clients instead. I own the architecture, the agent design and the product direction.

Co-Founder · HealthTech startup · Cardiac early warning
Building software for the early detection and prevention of heart attack, a problem where a few minutes of warning is the difference between saving someone and losing them. I work on product architecture and the signal pipeline.

Co-Founder · Admobify · Developer monetization
Infrastructure that lets developers inside constrained markets connect AdMob and actually receive their revenue. The hard part was payments, not code, and it had been keeping an entire region of builders out of the global market.

Community Organizer · Startup Legend · Founder community
Running a founder community: programming, coordination and growth.

HOW I WORK

Problem before stack
I open a problem down to its most basic parts, then take the tool it actually calls for: Rust for a native binary, Kotlin for Android, Flutter for cross-platform, TypeScript for the web.

New tech is not a cost
Learning an unfamiliar language or framework mid-project is normal for me. Four different toolchains, all self-taught, all shipped and public.

Speed to released
Idea to public release in weeks, working alone. I use AI tooling for speed; it never replaces understanding the code.

OPEN-SOURCE PRODUCTS: PUBLIC, SHIPPED, VERIFIABLE

Nava · Minimalist productivity app — ★ 25
Everyone adds features to fix focus; I removed them. Squircle geometry, haptic feedback and calm breathing animations: interaction tuned to Apple-native fidelity, not framework defaults.
Flutter · Dart · Riverpod · Haptics · github.com/Mahdi-mortazavi/app

Flow · Persian/RTL focus & habit app — ★ 75
Habit apps collapse the first day you miss, so I designed for failure instead of streaks. Fully offline and grounded in behavioral science: one priority a day, a timer that survives the app being killed, habits that come back after a missed day, and statistics that don't judge.
Flutter · Dart · Riverpod · SQLite · Jalali calendar · github.com/Mahdi-mortazavi/flow

Sooda · Profit & pricing calculator ★ 30

A calculator needs no server, no account, and none of your data. Bilingual English/Persian app for sellers: profit, margin, discount and real profit in one tap. Fully offline, tracks nothing, perfect Lighthouse scores across all four categories, deployed by GitHub Actions.

React · TypeScript · Vite · Tailwind CSS · IndexedDB · PWA · github.com/Mahdi-mortazavi/sooda

Mova · AI anti-procrastination app ★ 2

Perfectionism isn't a time-management problem, so I stopped treating it like one. A psychology-based app for people who stall at the starting line, built on React 19 and Vite with Gemini in the loop.

React 19 · TypeScript · Vite · Framer Motion · Gemini AI · github.com/Mahdi-mortazavi/Mova

Purify · Disk-cleanup utility for Windows ★ 3

Rust + Tauri instead of Electron, for a native-speed binary at a fraction of the size. The complexity stays behind the scenes; the user sees one simple, safe decision.

Rust · Tauri 2 · NTFS / MFT · TOML · GitHub Actions · github.com/Mahdi-mortazavi/purify

Relay · Android ↔ Windows connection sharing ★ 220

Every similar tool routes your data through a server; this problem never needed one. Local-only pairing between phone and PC: no cloud, no accounts, no telemetry. Privacy from the architecture, not from a policy page.

Kotlin · Jetpack Compose · .NET 8 · WinUI 3 · Go · WireGuard · GitHub Actions · github.com/Mahdi-mortazavi/relay

TECHNOLOGIES

Mobile	Flutter, Dart, Riverpod, Kotlin, Jetpack Compose, Android SDK, Swift
Systems & desktop	Rust, Tauri, C# / .NET, Go, WireGuard, Python
Web & backend	TypeScript, React 19, Next.js, Vite, PWA, Node.js
Infrastructure	Cloudflare Workers, Durable Objects, Supabase, Firebase, Railway, GitHub Actions
AI engineering	Gemini API, Multi-agent orchestration, Temporal, Windmill, Agentic coding
Product & design	Figma, iOS HIG interaction design, RTL & localization, PWA performance

AVAILABILITY

Available now for remote work, full-time or contract. Fastest reply on Telegram or WhatsApp; phone calls welcome. Send me a hard problem and I'll tell you within a day whether I can solve it and how I'd start.
